

VideoInspector uses state-of-the-art automated analysis technology to dramatically reduce the man hours spent searching video surveillance footage.

protrax[®]

VideoInspector

VideoInspector will automatically analyse Ovation Afterburner DVDs directly from the disc and log all events occurring in video sequences. Key information on each event, such as object size and position is stored in a searchable database linked to the video file. Once the database is created, the user can specify search criteria, e.g. a person walking through a doorway or a car traveling down a particular section of the road, and immediately view a timeline of the events without having to re-analyse the video.

If the selected search criteria are changed, the displayed event time-line changes immediately, without having to re-analyse the DVD. **VideoInspector** allows you to selectively navigate through the video footage, so that events of interest can be quickly found and viewed.

Features and Benefits:

- Saves you time and money
- Analyses and plays Ovation DVDs (AfterBurner)
- Automatic review of video footage
- Faster than real-time analysis
- Variable speed playback, forward and reverse
- Distinguishes between people walking past and through doors or passing cars
- Events selected based on position, size, speed, track, etc.
- 24 hour timeline displays all captured events and overall video activity
- Instantaneous re-analysis to detect alternative events
- Easy navigation to selected times and dates
- Creates a compilation video of events in standard video formats
- Automatically compensates for varying frame rates
